WATER AND  
SANITATION  
MANAGEMENT

# Citizen Science to the rescue

## Traditional monitoring methods:

- Expensive, time consuming.
- Require high-capacity laboratories and people (lacking in developing places).
- Low spatial and temporal resolution because of financial and logistic limits.
- Disconnect between data and people.

**VS.**

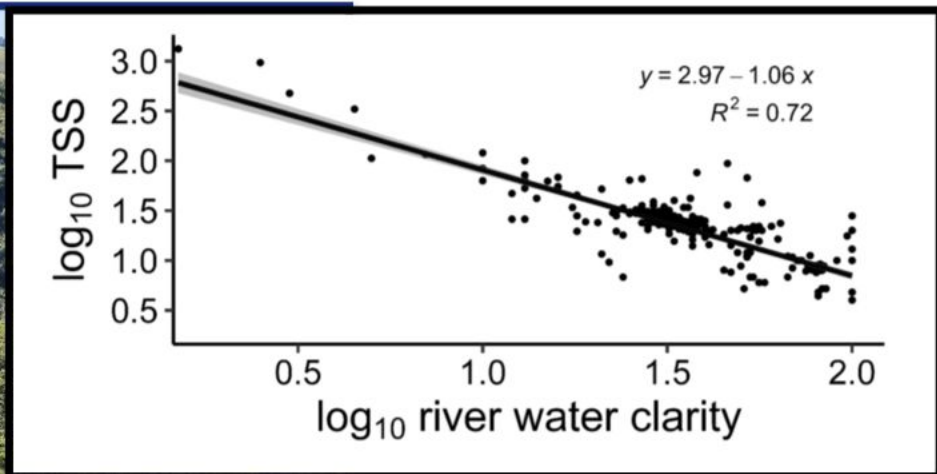

## Citizen science:

- Everyone can be one! Quick, intuitive, easy.
- Education, exposure, increase scientific literacy.
- Local / indigenous knowledge.
- A voice to disaffected, vulnerable, and marginalized people.
- Low-cost, high spatial and temporal resolution, high volume data.

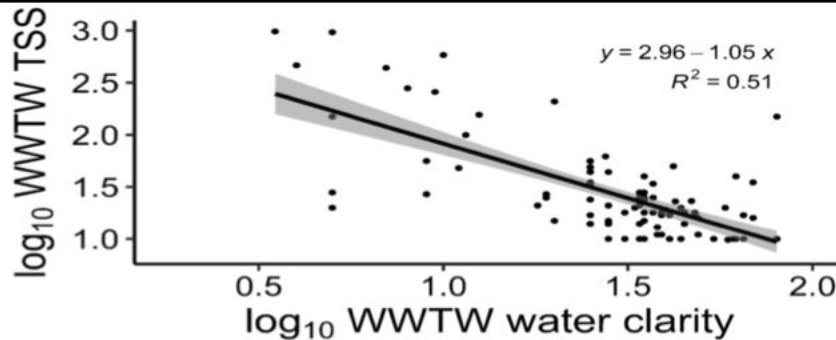

# Citizen Science: Clarity tubes

**Use the clarity to estimate total suspended solids for river quality monitoring.**

# Clarity tubes for WWTW effluent monitoring

Use the clarity tube to estimate total suspended solids in wastewater treatment works effluent for quality and compliance monitoring.

## amaBhungane | Free State's foul failure: The critical state of SA wastewater plants

Aisha Abdool Karim and Laura López  
González

Comments Bookmark

The sewage treatment plant section of the Vaal River.

PHOTO: Alister Russell, Gallo Images, Sunday Times

- 75% of SA's wastewater treatment plants deemed to be in a "critical" state have failed to deliver the recovery plans demanded by government's Green Drop report.
- The bleak situation in the Free State, where only one municipality out of 19 submitted plans, provides a vignette into the crumbling national infrastructure.
- Broken down, abandoned, and vandalised wastewater treatment plants continue to pollute South Africa's major water sources by flooding rivers with raw sewage.

# Citizen Science: Velocity Plank

- **Depth and the speed of river water flow.**
- **Observe patterns and changes.**

# Citizen Science: miniSASS

Aquatic macroinvertebrates each have unique sensitivities.

Highly sensitive species present = high score.

Only pollution tolerant species present = low score.

Easy, intuitive, and engaging biomonitoring tool.

The screenshot shows the miniSASS website interface. At the top left is the miniSASS logo, a water drop containing a crab and the text 'miniSASS STREAM ASSESSMENT SCORING SYSTEM'. To the right is the 'miniSASS' title in a stylized font. Below the title are four dark blue buttons: 'Explore the map', 'How to do miniSASS', 'Submit results', and 'Download resources'. In the top right corner, there are links for 'Login | Register | Reset Password', social media icons for WordPress, YouTube, and Facebook, and a 'Download miniSASS app' button with 'Google play' and 'App Store' logos. A search bar contains the text 'formation we receive is valuable'. Below the search bar is a navigation menu with buttons for 'Home', 'How To', 'Map', 'Downloads', 'Partners', and 'Contact Us'. The main content area features a large image of a damselfly nymph on a log. To the right of the image is a 'Recent Observations' section with three entries, each showing the location, username, organization, date added, and score. A blue banner at the bottom of the main content area says 'Welcome to miniSASS'. Below the banner is a question 'What is miniSASS?'.

# Citizen Science and Institutional Support

What is Citizen Science,

Oxford dictionary “ the practice of public participation and collaboration in scientific research to increase scientific knowledge”

Collaboration of the public and scientist in scientific and data analysis

California Academy of Sciences

# Why Citizen Science ?

Participation of the public in Science

Education /Capacity development

Sharing of knowledge

Science based decision making

Promotion of ownership of resources  
( Natural, artificial/ infrastructure,  
projects etc)

Knowledge generation ( increase  
scientific knowledge)

# Citizen Science cooperation and Digitisation

Mitigation of duplication work

Amplification of resources

Knowledge and solution sharing

Capacity building (training, tools and Infrastructure)

Digital platforms (ease of data collection and information sharing)- knowledge hubs and living labs

Scientific communication at large scale

**This is our land – Where we come from!**

## *Citizen Science & Heritage in southern Africa*

*Although it wasn't known as citizen science, in those days, citizen science as indigenous heritage has been practiced for hundreds of years in southern Africa.*

People living in rural villages have been able to 'read the water quality' in their streams and springs so as to collect clean water for their daily use.

One example is how people learnt not to drink the water unless they could hear it!

A photograph of a Secchi tube, a graduated glass cylinder used for measuring water turbidity. The tube is marked with numbers 100, 150, 200, and 240. The water inside the tube is a cloudy, yellowish-brown color, indicating high turbidity. The tube is held vertically against a background of green foliage.

## Overall approach to citizen scientist water quality monitoring

1. Co-design of monitoring protocol to complement agency monitoring activities and meet SDG 6.3.2 reporting objectives
2. Knowledge exchange and Training of local agency staff for recruitment, training and support of citizen scientists (Train the Trainer)
3. Identification of participating communities and recruitment of citizen scientists from each community
4. Training and knowledge exchange with local citizen scientists
5. Citizen scientist monitoring and quality control
6. Collaborative data analysis
7. Feedback and consultation with citizen scientists
8. Integration of citizen scientist for SDG 6.3.2 reporting and local river management

# Potential value of different citizen science approaches for water quality measurements

*While we can not observe all water quality components, it is possible to quickly obtain some information on stream health*

# CrowdWater and water quality observations

How do you rate the quality of the water in this waterbody?

Water quality  ...

Considering only the water quality, would you swim in this water?

 YES  NO

Would you drink this water?

 YES  NO

What colour is the water?

Colour of the water  ...

Can you see the riverbed?

 YES  VAGUELY  NO

Are there plants growing in the water?

 YES  NO

Do you see fish or other living beings in the water?

 YES  NO

Do you see any algae?

Algae  ...

Does the water have an odor?

 YES  NO

Is there litter in the water?

 NO LITTER  SOME LITTER, BUT NOT PROMINENT  ABUNDANT LITTER

Are there any signs of flow alteration for this waterbody – or do you know of any flow alterations for this waterbody?

Signs of flow alteration  ...

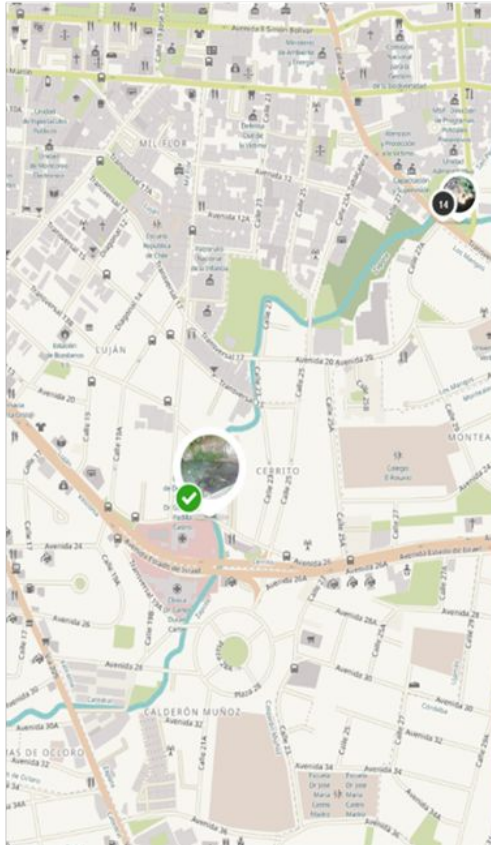

Do you see signs or know of causes of pollution in this waterbody?

Cause of pollution

*We use this information for **everyday decisions** e.g., whether to swim in the water or not*

*Traditional/local knowledge, human perception, old memories, narratives...*

# A visual approach for water quality observations?

- Visual/qualitative water quality observations in scientific literature (e.g. indigenous knowledge, human perception)
- Local people are usually the first noticing environmental changes
- Possible to observe and track changes over time
- Broader perspective and understanding of water quality conditions
